Project Proposal

I want to build a networking tracking app where people can add information about who they network with and add notes about every time they communicate. Ideally, the app would send reminders every few months to reach out to the person again. It's similar to a contacts app but with more functionality such as user login, reminders, adding a photo from phone library (maybe), etc.

Wireframes:

Database should store all of the above fields per connection. Store each user's connections separately.
